

Name _____

Date _____

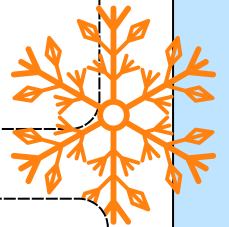

Hot Ice Experiment

Thermal Energy

Pre-lab Question

What happens when we freeze water?
The tiny particles in the water...

Definitions

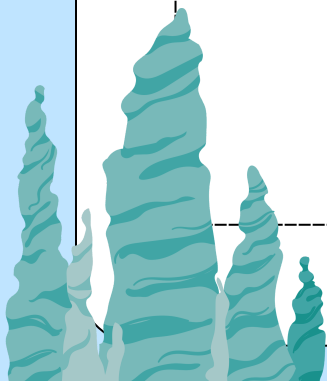

- **Temperature:** How hot or cold something is. It tells us how fast the tiny particles (atoms or molecules) inside an object are moving. If they're moving fast, it feels hot. If they're moving slow, it feels cold.
- **Thermal energy:** Energy that comes from the movement of tiny particles (atoms and molecules) in a substance. It is the total amount (or the sum) of energy from all those moving particles in an object.

Objective

To determine...

Experiment

Draw the crystal tower that
your group made.

Name _____

Date _____

Hot Ice Experiment

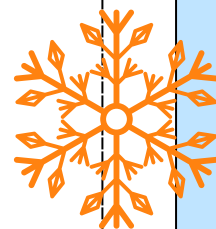

Thermal Energy

Experiment

The temperature of the ice felt...

This is because...

Takeaways

What does exothermic mean?

Exothermic means...

What is the relationship between temperature, energy, & state of matter?
